Section 1.

Objective Of The Roulette Game

The player's objective is to correctly guess and place wagers on which number on the wheel the ball will end up on. The player places bets on the Roulette table and if lucky collects a payoff the size of which is determined by how he/she bets. The odds range from 35 to 1 down to even money, depending on the likelihood of picking the correct number.

Section 2.

How to Play The Game

Roulette is played at a table that seats from one to six or seven players. There is the wheel and beside it the betting area known as the layout. The players make their wagers, the croupier spins the wheel to obtain the winning number and the players wait to see if they have won or lost.

This is one game where the player has absolutely nothing to do with picking the winning number. The spinning of the wheel and the releasing of the ball are all handled by the croupier, the player only has to decide on where to place the wager(s). The challenge in roulette is to bet in such a way as to win.

Section 3.

How to make Betting

There are several ways to bet in roulette, and as usual the harder it is to obtain the bet made the larger is the payoff.

When you play roulette you have to purchase special roulette bet unit, these bet unit are only used at the roulette table and must be cashed in for regular bet unit before leaving the table. The bet unit are a unique color for each player, this designates who owns the bet unit when it is time to pay off bets. Special bet unit are used in roulette because when using the betting area bet unit are placed in many locations on the layout and this keeps everyone from getting confused as to who has bet what. To discourage cheating by players who might be tempted to move their bet unit from a losing position to one that payoff players are to keep their hands away from the table until all winning bets have been paid off.

In roulette you have numerous betting options, the different bets are indicated by the placement of the bet unit on the table. They are usually grouped into two major categories:

- **Inside bets** - made on numbers directly inside the layout
- **Outside bets** - are made on the betting area on the roulette table bordering the number layout. Different tables have slightly different layouts for outside betting, you just find the location for the bet you want to make and place your bet unit there.

Inside Bets:

The number layout is the part of the table containing squares with the numbers in them. The squares are laid out 12 rows by 3 columns with the 0 and 00 numbers at one end.

0	1	4	7	10	13	16	19	22	25	28	31	34
	2	5	8	11	14	17	20	23	26	29	32	35
00												
	3	6	9	12	15	18	21	24	27	30	33	36

The inside bets are:

- **Single Number (Straight Bet, Double Zero or Zero)**

Betting on a single number, indicated by placing the bet unit in the center of the square containing the number you wish to bet on. Pays 35 to 1.

- **Split Bet**

Betting on two numbers, indicated by placing the bet unit on the line separating the two numbers you wish to bet on. Pays 17 to 1.

- **Corner Bet (Square or Quarter Bet)**

Betting on a block of four numbers, indicated by placing the bet unit on the intersection of the horizontal and vertical lines at the center of the block you wish to bet on. Pays 8 to 1.

- **Street Bet**

Betting on a row of three numbers, indicated by placing the bet unit on the line at the edge of the number layout on the row you wish to bet on. Pays 11 to 1.

- **Special Line Bet**

There is only one of these made by betting on five adjoining numbers (00,0,1,2 and 3), indicated by placing the bet unit on the line at the edge of the number layout straddling the zero rows and the first row. Pays 6 to 1.

- **Line Bet**

Betting on six adjoining numbers, indicated by placing the bet unit on the line at the edge of the number layout straddling the two rows you wish to bet on. Pays 5 to 1.

Terminology for inside Betting:

SPLIT : Bet on 2 numbers
\$ 1 bet wins \$ 17

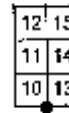

CORNER : Bet on 4 numbers
\$ 1 bet wins \$ 8

STREET : Bet on 3 numbers
\$ 1 bet wins \$ 11

DOUBLE STREET : Bet on 6 numbers
\$ 1 bet wins \$ 5

BASKET : Bet on 3 numbers
\$ 1 bet wins \$ 11

As an illustration

Roulette Inside Betting: If this is a \$5 table, you must bet at least \$5 per inside betting.

- Straight is an inside betting, bet on 1 number, \$1 bet wins \$35.
- Split is an inside betting, bet on 2 number, \$1 bet wins \$17.
- Basket is an inside betting, bet on 3 number, \$1 bet wins \$11.
- Street is an inside betting, bet on 3 number, \$1 bet wins \$11.
- Corner is an inside betting, bet on 4 number, \$1 bet wins \$8.
- Double Street is an inside betting, bet on 6 number, \$1 bet wins \$5.
- Any style or any way to make up a total of \$5 (or more) per inside betting.

The outside bets are:

- **Dozens**

There are only three ways to make this bet on the 1st 12 numbers, the 2nd 12 numbers or the 3rd set of 12 numbers. You indicate this bet by placing the bet unit on the location outside the number layout. Pays 2 to 1.

- **Odd or Even**

There are only two ways to make this bet, on all the odd numbers or on all the even numbers. You indicate this bet by placing the bet unit on the location outside the number layout. Pays even money.

- **Red or Black**

There are only two ways to make this bet, on all the red numbers or on all the black numbers. You indicate this bet by placing the bet unit on the location outside the number layout. Pays even money.

- **Column Bets**

There are only three ways to make this bet on the 1st column, the 2nd column or the 3rd column of numbers. You indicate this bet by placing the bet unit on the location outside the number layout. Pays 2 to 1.

- **1 – 18**

There is only one way to make this bet, on the first half of the numbers on the wheel (excluding 00 and 0). You indicate this bet by placing the bet unit on the location outside the number layout. Pays even money.

- **19 – 36**

There is only one way to make this bet, on the second half of the numbers on the wheel. You indicate this bet by placing the bet unit on the location outside the number layout. Pays even money.

As an illustration :

Roulette Outside Betting: If this is a \$5 table, you must bet at least \$5 per single unit.

- 1st Twelve is a single unit, \$5 wins \$10.
- 2nd Twelve is a single unit, \$5 wins \$10.
- 3rd Twelve is a single unit, \$5 wins \$10.
- 1st Column is a single unit, \$5 wins \$10.
- 2nd Column is a single unit, \$5 wins \$10.
- 3rd Column is a single unit, \$5 wins \$10.

- Red is a single unit, \$5 wins \$5
- Black is a single unit, \$5 wins \$5
- Odd is a single unit, \$5 wins \$5.
- Even is a single unit, \$5 wins \$5.
- 1-18 is a single unit, \$5 wins \$5.
- 19 -36 is a single unit, \$5 wins \$5.
- *You can bet as many single units as you want, but it has to be at least \$5 (or more) per single unit.*

Section 5.

101 Roulette Winning Tips

Golden Rules of Gambling

1. Gamble only with money you can afford to lose. Before you play roulette, you must always decide how much you should start, for example \$200. Once you have decided, you should stick to it. This way, you can limit your loss to a minimum during a bad day.
2. Decide beforehand how much you want to spend during your gambling session.
3. Don't exceed your predetermined spending limit if you lose. This is important if you want to win in roulette.
4. When you are winning, pocket some of the winnings - then gamble only with the remainder. As a rule, always pocket 50% of the winning.
5. If you decide to increase your bets, do so only when you are winning and then only in small increments. Don't be too GREEDY, otherwise you will lose all your winning.
6. Never ever play when you are tired. If you are tired, go for a short walk and take a breather for a while. Once you feel afresh, you can start a new session.
7. Never ever play when you have been drinking. This is also important because casinos always use this strategy to ensure that you lose your winning. Don't drink and gamble.
8. Only play games in which you know the rules of the game. Play the "For Free" or "Offline" version of the casino game until you are familiar with the rules.
9. Play only at games you can afford. You should be able to cover at least 25 bets during a session.

10. Keep your gambling and winning expectations reasonable. Decide on your target before you start playing. Once you reach your target, do take a break. Go for stroll and come back for a new session.
11. After five consecutive losses, either quit or play a different game.
12. If you find yourself in a losing streak don't chase the lost money. It's much better to cut your losses at \$100 rather than lose \$1000 just trying to get the \$100 back.
13. If you have a losing session, try to maintain a positive attitude - just consider it a deposit that you'll be back to withdraw at another time!
14. If it's not fun anymore - quit !
15. Don't be greedy; if you lose what you have just won, you are.
16. Don't gamble more than your set limit.
17. Don't stay beyond what you have set out to do. As a rule, do not spend more than four hours in a session. Whether you win or not, after four hours, you should take a break.
18. Play a few numbers, preferably winning numbers, every spin.
19. Increase your bet when you win and not when you lose.
20. Quit while ahead and limit your losses.
21. Don't be obsessed or addicted to gambling or your gambling is out of control.

What you should do before gambling

Before you start to play set your budget limit and stick to it. Set also your profit target amount and make it reasonable.

22. Watch how your bet is placed by dealers, they do make mistakes.
23. Leave while ahead. The feeling is great and you are likely to win again next time.
24. If you lose your set limit and cannot bear to watch others gamble, leave.

25. Never borrow money to gamble and don't lend either. Lending money to a friend who is losing badly is a sure way of losing him - and probably the lent money too.
26. Always keep a low profile, whether you are winning or losing.
27. Do your homework before you gamble online, not after. Read the rules, check the terms on bonuses and cashing out, in particular.
28. Check the customer service response before you sign up with an online casino. Make a phone call or send them an email with a question and see how long it takes them to reply.
29. Check if the online casino is a member of a known association. This won't be a guarantee, but it surely reduces the risk of being let down.
30. Be suspicious of anything that sounds too good to be true. It probably is.
31. Learn money management, it is more important than the game itself.
32. If you suspect you have a gambling problem, contact [Gamblers Anonymous](#).

What you should not do in gambling

33. Don't be afraid to bet. If you are not up to it, don't gamble.
34. Don't try to impress people by betting more than you can afford.
35. Where to sit. Don't sit to play. This is not the game to stay and play. Learn to attack and leave.
36. Don't throw your bet unit on the table. Always play defensively. If you don't know or are unsure what or where to play, it is simple...Don't Play until you are reasonably sure.
37. Don't increase your bets to try to recover losses.
38. Don't take your check book, ATM card, credit or debit card to the casino.
39. Don't be greedy; if you lose what you have just won, you are.
40. Don't gamble more than your set limit. Never, Never put the wager on the table before the spin or the game starts.
41. Don't stay beyond what you have set out to do.

- 42. Never quit after a win.
- 43. When you win a lot, don't think it's easy. It may feel that way but it never is.
- 44. Don't bet more than you can afford especially on a new game or a game that you don't know all the rules of.

Tips for the methodical gambler

If you bet methodically or want to devise your own betting system, then these are:-

45. Employ this 'one-way' winning strategy:

Start with minimal bets. When winning, intensify the betting progressively as you win risking only a calculated portion of your wins. Put NO limit to winnings as long as profit is progressing.

46. Set your target profit levels backwards.

It is easier to fulfill a target level backwards (as profit recedes) than forward. The danger of forward profit targeting is that you can get close to it, never quite make it, and then lose the lot. Backward profit level targeting is more suitable on low risk/win ratio betting systems; that is, you risk a little to win a lot but you win fewer times. Therefore when devising your system you should aim to win more money with fewer bets and in fewer winning rounds, hands or cues. Positive progression betting is one way to achieve that. This is usually a more efficient way to bet and gives you more flexibility in managing your winnings.

47. Approach gambling realistically. You cannot force a winning outcome and don't expect to win every time. Decide on a plan that lets you play in sessions or intervals, closing each session once certain criteria are met, and don't aim to win each one of them. Remember, what matters is the overall net profit result.

48. For those who play on an American Wheel (0 & 00 wheel):

Every time after you win, stock away the winning money. Every time when you lose a \$150 straight, you might be sitting on a "long losing streak" table. When you come across with a long streak table, you can leave this table to minimise your loss. Remember, when you come to 5th tries, which is betting \$5 x 14 numbers, win or lose this is your last bet. Restart a new betting cycle by using the most current number.

The chances of winning: 6 -7 wins out of 10 betting sections. Either win or lose, hardly breaking even here. A \$100 bet to win \$100 or more is common. If you are willing to quit with a \$100 (100 bet unit) win, you are always a winner. If you stretch it, you could make more. Stretch and continue to bet until you lose a \$150 straight. When lose a \$150 straight, it's time to quit, or wait it out. Do not double up betting and hope for a come back. American Wheel's "losing streak" could be long. If long, mostly over 7. It could be as long as 12, and it might happen repeatedly. If you think doubling up can make a big comeback, very unlikely. You will end up running out of bet unit and cause more damages; unless this table is usually not a "long losing streak" table. A normal losing streak should only be skipped 1, 2, 3, or 4. A bad one should be skipped 5 or 6. A terrible one is skipped 7-8, the killer is skipped 9 and over. For the same token, American Roulette's has long winning streak too.

49. For those who play on an European Wheel (single 0 wheel):

The chances of winning: 7-8 wins out of 10 betting sections. Win is very highly, breaking even should be easy, loss is possible. If you lose a 250 bet unit straight, you are having a very bad day, may be you should quit. The luck is against you, not worth staying. A \$100 bet to win a \$100 should be

easy. If you are willing to quit with a \$100 (100 bet unit) win, you are always a winner. Most of the time, the losing streak is skipped 1, 2, 3 and 4. Normally, European Wheel's "losing streak" is not long. The bad situation is to skip 5 numbers; then pick up winning again. So, breaking even is not hard to do. Once in a while, the losing streak could be 7 or 8. Very rarely the losing streak will be over 9 to 12 numbers. The pushing of winning over \$250 could be risky, but very possible. Most of the time, you will not need to use the back up money for breaking even or coming back, the original \$100 (100 bet unit) is good enough. Remember, when you come to 5th tries, which is betting \$5 x 14 numbers, win or lose this is you last bet. Restart a new betting cycle by using the most current number.

Roulette Strategy

50. Roulette Strategy is in the betting; the players have absolutely no control over picking the winning number. The spinning of the wheel and the releasing of the ball are all done by a croupier (the house), the players only involvement is in making wagers. So decide and just Bet.
51. In Roulette the house edge is the same for all possible bets. The only exception being the five-way bet on a double zero machine (1, 2, 3, 0, and 00) which gives the house a greater edge. So pick a number, or a group of numbers, and hope luck is on your side.
52. The only thing the player can do to improve his/her chances of winning is selecting a table that offers better odds. There are three different variations on the game of roulette; they offer the player different odds of winning, so when possible play the tables that offer the best odds for the player:

53. The standard double-zero wheel is the most common in North America. This machine gives the house a 5.26% edge; it is the worst table for players to win on.
54. **Each spin is independent.** The outcome of a spin is not determined by prior spins. Each spin is an independent event of chance. For example, after seven successive blacks, the chance of getting a red on the next spin is still as likely as getting a black. You should not base your strategy on the false assumption that a particular outcome is 'due' to happen.
55. European roulette pays **more** than American roulette
- The American roulette wheel has 38 numbers, including the numbers 1 to 36, a 0 ('zero') and a 00 ('double zero'). The European roulette wheel has 37 numbers, including the numbers 1 to 36 and a 0 ('zero'). In both games the house still pays 35 to 1 on a straight (one number) bet. This means European roulette offers better odds than American roulette. The house edge on all bets (except the five-number line bet) in American roulette is 5.26%, compared to 2.63% in European roulette. If you are planning to play roulette, always play single-zero European roulette, when offered a chance. For example, Microgaming casinos offer single-zero roulette.
56. **Avoid the five-number line bet**
- The worst bet you can make in roulette is the five-number line bet. With this bet you are betting on 0 ('zero'), 00 ('double zero'), 1, 2, and 3. The five-number line bet pays 6 to 1, which is equivalent to a 7.29% house edge. This compares to a 5.26% house edge on all other bets. So, never ever place the five-number line bet.

57. The surrender option favors the player

Normally an even-money bet (high-low bet, black-red bet, odd-even bet) pays 1 to 1 when you win and nothing when you lose. Sometimes a casino offers the option to surrender, which means that if you lose an even-money bet to a 0 ('zero') or 00 ('double zero'), you are offered an extra chance on the same bet. If you win the second bet you get to take your original bet back. The house edge on these bets is 2.63% for American roulette and 1.35% for European roulette. Some Cryptologic casinos offer the option to surrender.

58. **Probability Theory of Roulette System**

You must understand the probability of every outcome so that you can use this information to your advantage.

Bet on	Pays	Probability
Red	1:1	46.37%
Black	1:1	46.37%
Even	1:1	46.37%
Odd	1:1	46.37%
1 to 18	1:1	46.37%
19 to 36	1:1	46.37%
1 to 12	2:1	31.58%
13 to 24	2:1	31.58%

25 to 36	2:1	31.58%
Any one number	35:1	2.63%
Two number combination	17:1	5.26%
Three number combination	11:1	7.89%
Four number combination	8:1	10.53%
Six number combination	5:1	15.79%
0, 00, 1, 2, 3 combination	6:1	13.16%

59. In Europe (and recently at some North American casinos) roulette is played on a wheel that contains only one zero. The single zero wheel reduces the house edge to 2.70% and offers the player better chances of winning. Some casinos offer both, which leads to the question 'considering the odds why would anyone play a double zero machine if a single zero machine is available?'. So Always choose the table with a single zero as it will increase chance of winning.
60. In Europe they have a variation called "en prison" that reduces the house edge to 1.35% and represents an even better chance for players. The "en prison" variation is offered when the zero is the winning number. Instead of the house claiming all of the money bet the player has the option of losing half of the wager or leaving the wager and waiting for the outcome of the next play. If the player had originally bet on red to win and the next play

results in a red number then the players money is returned to him (without the usual payoff). These two European variations may explain why roulette is played much more in Europe than in North America. Always choose the table with "en prison " variation .

61. **The "En Prison " Rule**

A roulette rule applied to even-money bets only, and by some casinos (not all). When the outcome is zero, some casinos will allow the player to either take back half his/her bet or leave the bet (en prison = in prison) for another roulette spin. In the second case, if the following spin the outcome is again zero, then the whole bet is lost.

62. The 'La Partage' Rule

The la partage roulette rule is similar to the en prison rule, only in this case the player loses half the bet and does not have the option of leaving the bet en prison for another spin. This refers to the 'outside' even-money bets Red/Black, High/Low, Odd/Even and applies when the outcome is zero. Both the La Partage and the En Prison roulette rules essentially cut the casino edge on the 'even-money bets' in half. So a bet on Red on a single-zero roulette table with the la partage rule or the en prison rule has a 1.35% house edge and one on a double-zero roulette table has a house edge of 2.63%.

- 63. Mathematics and Gambling don't mix. In mathematics you know exactly what will happen. Gambling is the exact opposite, you never know what will happen, otherwise it wouldn't be gambling. If you try to calculate the possibilities of winning mathematically, it is unlikely that you will get anywhere even if there was no casino advantage - no 0, 00.
- 64. For an efficient betting strategy aim to win more money in fewer winning spins. You must choose a betting strategy that gives you more wins in fewer spin.
- 65. Always spend some time learning to read and interpret the **READERBOARD**. This is the clear and present predictor of what has happened on the table you are playing. If the table does not have a Readerboard or if it is malfunctioning , DO NOT Play this table. Starting from the bottom and read to the top. The recent HIT is at the top.
- 66. Dissect and analyse the number on the readerboard. First include the number for the current dealer. Look for a pattern such as " are the numbers in the first dozen, 2nd dozen or 3rd dozen" , " are there any repeats", "are the number in the 1st row, 2nd row, 3rd row". Don't play against the trend. The trend is your friend.

67. If you are influenced by previous results, then learn to bet with the outcome and not against it. You will eventually realize that it makes no difference. If anything, the **Law of Unequal Distribution** will be on your side. Follow the trend is a good strategy.
68. On a very bad day, no sum of wagering money or degree of skill will make you a winner. Don't persist. Cut your losses early.
69. Don't challenge the mathematical advantage of the casino. You cannot eliminate or change it and you don't need to. It is not your adversary unless you choose to make it that way and you will lose - slowly but surely. It is relatively small considering the sums of money that can be won or lost in a very short space of time. Think of it as a necessary and acceptable contribution or a tax towards paying the cost of the gaming equipment and salaries of the casino personnel. Remember, you pay it if and when you win only.
70. If you are new to the roulette game, you are probably looking for mathematical roulette systems that exclude luck. There are many on the net from free to highly priced and some promising riches. Look no further, they are all here.
71. No system tester has ever produced a conclusive positive result for a roulette system - not once. That's because the luck factor will always be missing. If you devise your own system, try it out for real in actual play and don't rely on collected lists of decisions. The free on-line and off-line casino games are useful to carry out preliminary tests. Remember, luck cannot be quantified or spread evenly and recorded lists of decisions will never reoccur again in that order. The probability of a sequence of just four

numbers coming up again in the same order is $1/38 \times 1/38 \times 1/38 \times 1/38 = 1/2,085,136$. That's one in two million.

72. There are more gambling systems, betting systems, wagering methods and roulette systems devised to beat the roulette wheel than any other game. A system may give you an edge, but don't expect to *systematically* play your way to riches off the casinos. For one thing, everything considered, it is a very difficult task. For another thing, it's unlikely that the casinos will sit back and do nothing about it.
73. Aiming to win to stay ahead at all times as a primary objective, even by a small margin, is a more realistic goal and a great achievement. Set a realistic goal.
74. In a game of chance using a system is no guarantee of winning, but a well devised roulette system can streamline your losses, control your winnings and have a strategy that will give you an opportunity to be a winner.
75. Roulette systems that have a strategy to win most of the time but lose out overall, are not winning systems. A winning system is one with a strategy to make you win overall and keep you ahead at all times.
76. It has been shown time and again that roulette systems that rely on sequential or conditional probability have failed to produce successful results consistently. That is because, in practice, roulette is not a game of probability.
77. **The Secret Revealed of Roulette Probability Analysis**
As mentioned, at roulette each spin is a new spin and the outcome is never determined by prior spins. After eight successive blacks, a black is as likely

to come up as a red. You may argue that the reds and blacks will eventually even out over a long run, and you would be right. Indeed, we are both right.

The strategy is if after at least five successive blacks, bet on red using progression or vice versa.

78. Roulette game always has a 50:50 chance. Let's first analyse why the odds are the same each spin of the wheel even if the outcomes even out over a long run. In order to simplify the calculations, we will assume that the roulette wheel has no zeros, just 18 red and 18 black slots.

Consider this:

In, say, 1,000,000 roulette spins you would have in theory 500,000 reds and 500,000 blacks appearing. Now, we know they don't come up in turns one at a time, that is, you would expect to see two, three, four or more in a row in either colour to appear. For this analysis we will consider the 'eight blacks in a row sequence' as the typical example.

If you were to count all the occurrences of eight blacks in a row FOLLOWED BY A RED, you will find an equal number of occurrences of eight blacks in a row FOLLOWED BY A BLACK (9 blacks in a row). You will also find an equal number of eight reds in a row in the same way making the total number of blacks and reds equal. If you have a computer roulette simulator, try it out. This means that of the 'eight blacks' sets there are 50% eight blacks in a row FOLLOWED BY A RED and 50% eight blacks in a row FOLLOWED BY A BLACK. The same applies to the 'eight reds' sets. Therefore if you bet red after eight blacks in a row or if you bet black after eight reds in a row, you will have a 50:50 chance of getting it right.

This is true no matter how many times black or red come up in a row, because for every occurrence of, say, 8, 10 or 20 blacks in a row FOLLOWED BY A RED there will be one with 8, 10 or 20 blacks in a row FOLLOWED BY A BLACK. You just don't know which of the two sequences will come up first.

After eight blacks in a row, your chances of winning are still 50:50 whether you bet on red or black.

79. **The myth of the 'delayed' double up betting strategy':**

It is a known fact that many players wait for, say, four blacks in a row to appear and then start betting on red doubling up the bet up to four times (or more) if they lose. They do this believing that they have gained a sequential probability advantage - the four successive blacks with no bet. Indeed if you use this strategy, **you will win most of the time** and you will probably conclude that you have an advantage.

You would be wrong! Take a look at the following figures:

Starting with one bet unit, if you double up your bet up to four times on red and win, you would win one bet unit. If you lose on your fourth doubling up bet, you would lose 15 bet unit ($1 + 2 + 4 + 8 = 15$). All it takes is one in 16 attempts that you lose and you would have lost all your 15 wins.

Now, try the same double up strategy but bet randomly on red and black. That is, ignore what came up, just bet at will - sometimes red sometimes black and on different tables (switch tables). All you know is this: If you lose you will double up your bet, up to four times. On a long run you should get the same results as your planned one-colour one-table double up betting strategy.

The reason is that it is not the probability of colour that is at work, it is the **probability of losing four times in a row** on a 50:50 chance bet, which is $1/2 \times 1/2 \times 1/2 \times 1/2 = 1/16$. You would in fact in the long run **win 15 times** and lose one time every 16 attempts, on average. Net profit = 0. This is a zero game.

Theoretically, “delayed” double up strategy may fail to work, but practically, this strategy could be a winning strategy. I have personally tried this strategy, it works 90% of the time.

80. Some people believe you can always break even at roulette by always betting even money, then doubling down after every loss and return to the lowest bet after a win. This is called the Martingale system. However, in practice this is not possible because every roulette table has a maximum imposed on the bet size. **The Martingale System** is in fact based on the probability of losing *infinite* times in a row.

After a couple of sequential losses it is no longer possible to double down, and you will lose. In fact never believe anyone who claims having invented a winning roulette system. As with all games of chance, whether you win or lose doesn't depend on the system you are using, but on luck and common sense.

Although infallible in theory, the Martingale system requires a large bankroll, has a very low return and is a very risky one because of the maximum bet limits imposed by the casinos. If you run out of money or reach the house limit, you can lose a lot with no chance to recover it.

81. **The Gambler's Fallacy.**

At roulette each spin is a new spin and the outcome is never determined by prior spins. Therefore the probability for a possible outcome is the same for each spin and a probability advantage cannot be generated.

For example:

Which outcome has a higher probability after eight successive Blacks, Black again or Red?

The probable answer is Red.

Wrong! After eight successive Blacks, a Black is as likely to come up as a Red. The roulette wheel has no memory and it does not keep record of previous results. This is what many gamblers find hard to believe. This misconception has been around for many years and will probably be around for as many more years. It is known as the gambler's fallacy.

In theory, roulette may be looked at as a game of probability and that the casino advantage of 5.26% with a double zero wheel (2.7% with a single zero wheel) makes the player a definite loser. In practice, as far as the player is concerned, roulette is a game of luck and the player has a chance to win.

If you were to bet \$5 on Black for 38 spins on a double zero wheel, in theory you would win and lose every other spin and after 38 spins (which is about an hour of play at a busy roulette table) you would lose \$10 for twice the zero outcome.

In practice, during an hour of play, at some stage, if you were lucky you would be up and if you were unlucky you would be down by more than \$10, and deciding then to quit will determine the amount of your winnings or losses.

If there was no casino advantage and you were paid 37 to 1 (36 to 1 for a single zero wheel) instead of 35 to 1 on numbers and didn't lose on the outside bets when the outcome was zero, during the past several times that you have played the roulette, would you now be even with your money? Chances are it would not make much difference. You would still be either winning or losing and by much more than 5.26%.

82. The reason is that at roulette by far the **two major factors** that determine how much you win or lose are:

1. **Your luck** on the day and
2. Deciding when is the **best time to quit**.

Therefore, for a roulette system to have a degree of success it has to be linked to luck and tell you exactly when to quit.

Additionally, a good system has to take into account other obscured but important advantages for both, the casino and the player. These are:

To the casino:

1. The player's natural greed for money
2. The player's lack of self-discipline and
3. Time (the longer you play the higher the chances that you hit a streak of bad luck and run out of money).

To the player:

1. You can choose when and where to bet
2. You can choose and vary the amount of your bet and
3. You decide when to quit.

Now, if you agree to all that has been said so far and give it some thought, you could well apply a roulette strategy yourself that is linked to luck.

Additionally, if you are able to weaken the above said 3 casino advantages (not easy) and make good use of the player's 3 advantages, chances are in the long run you will come out an overall winner.

83. Do the odds change with every spin of the roulette wheel?

Is number 20 less likely to come up after four successive outcomes? Four successive outcomes of the same number, say; 20 20 20 20, is a rarity. Indeed, the sequential probability of four 20s coming up in a row is very high ($1/38 \times 1/38 \times 1/38 \times 1/38 = 1/2,085,136$), but the absolute probability of number 20 to come up at each spin is always 1 in 38 (on a double zero Roulette wheel).

If a sequence of four of the same number is a rarity, a sequence of any four numbers is equally a rarity such as 32 12 5 26 or 21 8 35 13. This is not obvious simply because a sequence of 20 20 20 20 is easier to notice than, say; 32 12 5 26. If you have never seen an outcome of four 20s in a row, it is unlikely that you have seen a sequence of 32 12 5 26 or 21 8 35 13. They are just as rare to occur.

Therefore, five successive outcomes of the same number, like 20 20 20 20 20, will be as rare as 20 20 20 20 X, where X can be any number on the Roulette wheel. Although such a sequence is indeed more of a rarity, the number 20 is no more or less likely to appear as the fifth number in the sequence.

84. Advantage: **Dealer Signatures**

Why Dealer Signatures Exist . . .

Many roulette dealers tend to repeat “near identical” conditions in many of their spins – not consciously, but due largely to rote, repetition, or muscle memory forming predictable patterns – or “signatures.”

Identifying the dealer signature enables the advantage player to predict the area of the wheel or sector into which the ball will fall. Obviously not every time, but often enough to give you a measurable advantage over the casino. Use the Readerboard to find the Dealer signatures. This is the dealer DNA. Collect the last 30 spins and categorise them into 1st twelve, 2nd or 3rd twelve or 1st, 2nd, 3rd column. Find the dominant twelve or column. **That is the dealer DNA. Bet on that until the trend change. This is only applicable for OFFLINE Casino. Some Online Casino have these features. Analyse and Choose the right casino to play.**

85. **Money Management Strategy**

You choose to manage your money is an integral part of any gambling strategy. Before each internet gambling session, a smart gambler determines what his/her bet unit will be and when to quit.

This action plan has its rewards - it can bring you joy (Wow, I walked away a winner!) and save you grief (I reached my loss limit, so I stopped).

Establishing a bet unit: If you are a conservative player, your bet unit should be **1%** of your bankroll. For example, with a \$500 bankroll your bet unit is \$5 ($\$500 \times .01 = \5). If you are an aggressive player, 2% of your bankroll may be used as your bet unit (with a \$500 bankroll, your bet unit

would be $\$500 \times .02$, which is \$10). The important fact to remember when establishing your bet unit is that the fewer the units, the higher the risk of bottoming out during a gaming session.

When to quit: Set a win goal and a loss limit for the gaming session. Establishing a predetermined amount to win or lose will help you maintain control over your gambling. Both win amounts and loss amounts should be reasonable.

A loss limit of losing five consecutive game plays, or losing five bet units is reasonable. If you've met your loss limit during the session, why stay to lose more? Simply quit and take a break.

Establishing a win goal is a foreign concept for most gamblers. If you've met your win goal - simply cash out and take a break. Whether you set a win goal of one bet unit, or ten bet units, a winner is a winner - take your profits and take a break!

86. **House Advantages**

Every casino game has a built in profit on every bet. This profit is known as the House Edge, or House Advantage. This is how casinos go about extracting money from players in order to increase their revenues and stay in business.

Skilled players can cut the house advantage to zero or even swing the odds in their favor. At the minimum, a skilled player can cut the casino's edge to less than 1 percent. Skilled players not only know the rules of the games they play, but also follow a sound strategy for the games they play.

The lesser the house advantage, the more favorable the game is to players. Online casinos generally have lesser house advantages and more flexible rules than land-based casinos. Online casinos do not have the overhead and personnel cost of land-based casinos, therefore online casinos can afford to give the player a better advantage.

87. **How to Manage Your Bankroll**

The first step in proper management of your bankroll is to budget a given amount to gamble with and then stick to that amount - win, lose or draw. This is an essential step in responsible gambling.

The size of your bankroll now determines your bet unit. If you are a conservative player, your bet unit should be 1% of your bankroll. For example, with a \$500 bankroll your bet unit is \$5 ($\$500 \times .01 = \5). If you are an aggressive player, 2% of your bankroll may be used as your bet unit (with a \$500 bankroll, your bet unit would be $\$500 \times .02$, which is \$10). The important fact to remember when establishing your bet unit is that the fewer the units, the higher the risk of bottoming out during a gaming session.

At times you can have extremely wild fluctuations in your bankroll - both positive and negative. This is the price we pay to play. Knowing this, the best bet you can ever make is to walk away from the casino game when you find yourself in the positive range (i.e., a winner). The longer you play the more you increase your chance of getting closer to a negative outcome (i.e., a loser).

The best advice to follow is to never play games you cannot afford, never make wagers beyond your predetermined limit, and always quit when you're ahead.

88. **10 ways to beat the casino at online roulette.**

1. Pick a reputable CASINO:

Search online to find casinos that are reputable and have good payment histories. All sites on this ebook have been personally researched. They have proven themselves to us with fair odds, good customer service, and rapid payments on cash ins. Other sources to find reputable sites: Refer to Section 4. or

[Free casino](#)

[Casino Bonuses](#)

2. Find the best ODDS:

Not all online casinos offer the same versions of roulette. The odds can be changed dramatically by adjusting a few of the rules in the house's favor . These adjustments could totally make or break your session. Make sure you know the rules before you play.

3. Follow the right roulette strategy that you will learn later

Roulette strategy shows you how to play each spin for every possible scenario.

4. Find the best bonuses:

Bonuses are the reason why people gamble online. The online casinos have to provide huge bonuses to draw people in. Most offer at least 100% cash match on your initial purchase. Use sites mentioned in Section 4 to find the casinos with the best bonuses. Use caution: some casinos offer big bonuses, but are not reputable or have poor odds. Also, most have wagering requirement to fulfill before you are eligible for the bonus or cashout.

5. **Limit your Losses:**

Limit your losses to your initial bet unit purchase only. Most bonuses only apply to initial bonuses. If you lose your initial deposit, then it is time to move on to a new [casino](#). This method will maximize your overall wins by getting more introductory cash bonuses at the casinos.

6. **Cash-in your Wins:**

Know how to take a profit. How many times have you had a friend who was up "a couple of grand" only to come back a little later with nothing? We recommend the following strategy:

Play until you have fulfilled the wagering requirements for the bonus. We recommend playing slightly over the wager requirements to avoid being labeled an "advantage" player by the casino. If you are still ahead after this, the first cash in should occur when you have doubled your initial deposit (not including the bonus.) Cash in 2/3rds of your money, leave the rest to attempt to win more. Continue to cash in half your money every time you double after that. Once you have no money left to play, take your win and time to go to another casino and enjoy another introductory offer.

7. **Wager Small until meeting wager requirements:**

By wagering small initially, you increase your odds of being able to fulfill the wagering requirements. Remember, you need to wager at least 9x's the [bonus](#) amount at most of the casinos before you can cash in a bonus (check rules at each casino.) By betting small until you meet the wager requirements,

you increase your odds of being able to cash in the bonus.

8. Know your Banking Options:

Some casinos won't accept credit cards for online gambling because the credit card companies do not wish to accept online gambling transactions. For a list of casinos that almost always accept credit card transactions, click [HERE](#). Other options for online banking include [Firepay](#) and [Neteller](#). These sites are online cash transfer companies that allow you to transfer funds from your bank account, to their site, then to the casino. Both companies are safe, secure, and reputable. Many casinos tack on 10% for deposits made via neteller and firepay increasing your odds even more.

9. Use your Resources:

Know where to look online for the most complete, honest, insightful, and useful information about online roulette gambling. This book is an excellent starting point. We also recommend you checking out sources mentioned later. Avoid cheesy sites that are trying to deceive you.

10. Kickbacks: Download from Kickbacks Sites

Online casinos pay websites such as OBG to bring traffic to their sites. OBG earns money every time someone clicks from a link on our site to a casino and then wagers money. OBG takes this money, and returns part of it to the player in a form of a "kickback." We are the only site in the world that currently gives players a kickback. Kickbacks are at least 10% on all losses. The kickback is another way for you to be profitable against the online casinos and increase your chances of winning

Roulette System/Strategies

89. **Roulette Fortune Bookie Strategy**

Visit [Roulette Fortune Bookie Strategy](#)

According to this strategy, the Roulette is predictable. Every dealer has signature spins. Each table has signature sections. Most important of all, every roulette number has its own signature number group. The truth of these statements at many casinos have been tested and demonstrated.

It is a proven fact that most winning numbers are followed within a few spins by a member of a certain group of numbers. This group of numbers is referred to as a "signature number group". *Roulette Fortune Bookie* is a research based how-to book that contains information regarding these signature number groups. Come and discover the power of roulette's signature number groups. This book provides hard facts on real numbers that help players bet and win. It also provides formulas for assisting players to predict winning numbers on their own. *Roulette Fortune Bookie* will help make your gambling money last longer, significantly increase your chance of winning, and add to the excitement of your gambling experience.

Inside betting will either win big or lose fast; as \$1 bet with a \$35 reward is hard to resist. The key to winning is: the fewer numbers you bet on, the higher the return you will get. The more numbers you bet on, the smaller the return you will get. When a player begins to bet by covering a lot of numbers - particularly if he bets different amounts on the various numbers - that 's the beginning of losing money fast. never bet on more than 14 numbers.

- Stick with approximately 8 numbers (preferable fewer than 8). Second, **Always bet equal value (same amount) on each number.**

Betting Strategy for Inside Betting:

The research data has demonstrated that roulette is a very predictable game. Most numbers are usually followed within a few spins by a member of an associated group of numbers. These numbers are referred as "signature numbers group". In this book, the author will discuss three particular winning patterns of inside betting and their signature groups. These three winning patterns are:

- (1). the table that favors the twelves;
- (2). the table that favors the columns;
- (3). the table that favors numbers randomly.

- The Table That Favors The Twelves:

Number 1 through 12 is the 1st twelve

Number 13 through 24 is the 2nd twelve

Number 25 through 36 is the 3rd twelve

First find out what the last winning number was. Then turn to the "**Last Winning Number**" page for that number and bet according to the suggestions given. For example, if the last winning number was #2, see Roulette Fortune Brokie.

- As a rule of thumb, **if the table favors the 1st twelve**, our formula is to wait and hunt the **skip one**, and the **skip three**. What is **skip one**? **Skip one** means skip one number. If the last winning number is #2, skip one means either #35 or #28. Skip three means either #4 or #26. Most of the time, the number should hit within 1 to 6 spins.
- *The combination of hot 1st Twelve & 2nd Twelve usually associate with 00 or 0.*

- **If the table favors the 3rd twelve**, the formula is wait and hunt the **skip three**. What is skip three? Skip three means skip three numbers. If the last winning number is #2, skip three means either #4 or #26. Most of the time, the number should hit within 1 to 6 spins.
- *The combination of hot 2nd & 3rd twelve usually do not associate with 00 and 0.*
- **The Last Winning Number was 2**

Fact 1:

Number 2's signature group numbers are:

**01, 02, 04, 05, 06, 14, 17,
20, 22, 26, 28, 32, 35, 0**

This is the 14-number signature group. Bet \$1 on each number, using progressive betting.

Active number 2 usually associates with:

Black Color & 0

Use the following 8-number group when #14, 17, 20 & 23 are not hot.

This group favors non- repeat numbers.

04, 05, 06, 26, 28, 32, 35, 0

Bet \$1 on each number, equal value or progressive betting.

Use the following 8-number group when #14, 17, 20 & 23 are not hot.

This group favors repeat numbers.

01, 03, 04, 06, 22, 26, 28, 0

Bet \$1 on each number, equal value or progressive betting.

- The last winning number was 2

Wait & Hunt:

When the table favors 1st & 2nd twelve,

Number 2 is usually followed by:

01, 02, 04, 05, 06, 17, 20, 0

Wait & Hunt:

When the table favors 1st & 3rd twelve,

Number 2 is usually followed by:

04, 05, 06, 26, 28, 32, 35, 0

Wait & Hunt:

When the table favors 2nd & 3rd twelve,

Number 2 is usually followed by:

17, 20, 22, 26, 28, 32, 35, 0

Wait & Hunt:

When the table favors 1st & 2nd column,

Number 2 is usually followed by:

01, 04, 05, 20, 26, 28, 35, 0

-

Wait & Hunt:

When the table favors 1st & 3rd column,

Number 2 is usually followed by:

01, 03, 04, 06, 22, 26, 28, 0

Wait & Hunt:

When the table favors 2nd & 3rd column,

Number 2 is usually followed by:

02, 05, 06, 20, 26, 32, 35, 0

- **The Last Winning Number was 31**

Fact 1:

Number 31's signature group numbers are:

04, 06, 08, 11, 13, 18, 21,

26, 28, 29, 32, 33, 34, 35

This is the 14-number signature group. Bet \$1 on each number, using progressive betting.

Active number 31 usually associates with BLACK color

Use the following 8-number group when #14, 17, 20 & 23 are not hot.

This group favors non- repeat numbers.

06, 08, 11, 26, 28, 29, 33, 34

Bet \$1 on each number, equal value or progressive betting.

Use the following 8-number group when #14, 17, 20 & 23 are not hot.
This group favors repeat numbers.

04, 06, 13, 18, 21, 28, 33, 34

Bet \$1 on each number, equal value or progressive betting.

- **The last winning number was 31**

Wait & Hunt:

When the table favors 1st & 2nd twelve,

Number 31 is usually followed by:

04, 06, 08, 11, 13, 16, 18, 21

Wait & Hunt:

When the table favors 1st & 3rd twelve,

Number 31 is usually followed by:

06, 08, 11, 26, 28, 29, 33, 34

Wait & Hunt:

When the table favors 2nd & 3rd twelve,

Number 31 is usually followed by:

18, 21, 26, 28, 29, 33, 34, 35

Wait & Hunt:

When the table favors 1st & 2nd column,

Number 31 is usually followed by:

08, 11, 26, 28, 29, 32, 34, 35

Wait & Hunt:

When the table favors 1st & 3rd column,

Number 31 is usually followed by:

04, 06, 13, 18, 21, 28, 33, 34

Wait & Hunt:

When the table favors 2nd & 3rd column,

Number 31 is usually followed by:

06, 08, 18, 21, 29, 32, 33, 35

90. **Step-by-step of putting 14 numbers group strategy into reality:**

The following winning numbers were real winning data. Although our hot tips and strategies are very helpful in increasing the odds of winning roulette, however they are not a 100% sure thing. As roulette gambling highly depends on your luck, your skill and your action at the right moment. Please consider all our roulette winning strategies are purely speculations. Gambling is risky and could cause damage to your bank account.

Current roulette winning number was #5
Roulette Fortune Bookie (Page 28): #5's signature group = 02, 03, 04, 06, 07, 08, 09, 12, 22, 23, 25, 27, 32, 34
Ray's bank roll : 100 bet unit - current bet 14 bet unit = 86 bet unit remained

Ray just joined the table, cash changed \$100 for 100 bet unit (\$1 = 1 bet unit). Ray used #5's signature group to begin a new betting cycle. He would bet on the same 14 numbers until won. If won, Ray would end betting on these 14 numbers. Otherwise, he would add an extra bet unit

for the next spin until won. **Ray now started his first game. He bet \$1 each** on 02, 03, 04, 06, 07, 08, 09, 12, 22, 23, 25, 27, 32, 34. A total bet of \$14 for the coming spin, \$86 remained.

Current roulette winning number was #34
Roulette Fortune Bookie (Page 28): #5's signature group = 02, 03, 04, 06, 07, 08, 09, 12, 22, 23, 25, 27, 32, 34
Roulette Fortune Bookie (Page 86): #34's signature group = 01, 03, 04, 05, 12, 14, 21, 22, 23, 24, 30, 31, 32, 36
Ray's bank roll : 86 bet unit remained + 36 bet unit won - current bet 14 bet unit = 108 bet unit remained

Ray won. He won \$35 + \$1 original bet = won \$36. He now picked up the current winning number #34's signature group to begin a new betting cycle. **He bet \$1 each** on 01, 03, 04, 05, 12, 14, 21, 22, 23, 24, 30, 31, 32, 36. A total bet of \$14 for the next spin, \$108 remained.

Current roulette winning number was #34 again
Roulette Fortune Bookie (Page 28): #5's signature group = 02, 03, 04, 06, 07, 08, 09, 12, 22, 23, 25, 27, 32, 34
Roulette Fortune Bookie (Page 86): #34's signature group = 01, 03, 04, 05, 12, 14, 21, 22, 23, 24, 30, 31, 32, 36
Ray's bank roll : 108 bet unit remained - current betting 28 bet unit = 80 bet unit remained

Ray lost. Ray now bet \$2 each on 01, 03, 04, 05, 12, 14, 21, 22, 23, 24, 30, 31, 32, 36. A total bet of \$28 for the next spin, \$80 remained.

Current roulette winning number was #31
Roulette Fortune Bookie (Page 86): #34's signature group = 01, 03, 04, 05, 12, 14, 21, 22, 23, 24, 30, 31, 32, 36
Roulette Fortune Bookie (Page 80): #31's signature group = 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35.
Ray's bank roll : 80 bet unit + 74 bet unit won - current betting 14 bet unit = 140 bet unit remained

Ray won. He won \$72 + \$2 original bet = won \$74. He now picked up the current winning number #31's signature group to begin a new betting cycle. **He bet \$1 each** on 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35. A total bet of \$14 for the next spin, \$140 remained.

Current roulette winning number was #2
Roulette Fortune Bookie (Page 80): #31's signature group = 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35.
Roulette Fortune Bookie (Page 22): #2's signature group = 01, 02, 04, 05, 06, 14, 17, 20, 22, 26, 28, 32, 35, 0
Ray's bank roll : 140 bet unit - current betting 28 bet unit = 112 bet unit remained

Ray lost. He did not pick up #2's signature group to begin a new betting cycle. Ray stayed with #31's signature group until won. **Ray now bet \$2 each** on 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35 until won. A total bet of \$28 for the next spin, \$112 remained.

Current roulette winning number was #33
Roulette Fortune Bookie (Page 80): #31's signature group = 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35.
Roulette Fortune Bookie (Page 22): #2's signature group = 01, 02, 04, 05, 06, 14, 17, 20, 22, 26, 28, 32, 35, 0
Roulette Fortune Bookie (Page 84): #33's signature group = 08, 11, 13, 16, 18, 21, 23, 24, 26, 29, 30, 31, 35, 36.
Ray's bank roll : 112 bet unit + 74 bet unit won - current betting 14 bet unit = 172 bet unit remained

Ray won. He won \$72 + \$2 original bet = won \$74. He now picked up the current winning number #33's signature group to begin a new betting cycle. **He bet \$1 each** on 08, 11, 13, 16, 18, 21, 23, 24, 26, 29, 30, 31, 35, 36. A total bet of \$14 for the next spin, \$172 remained.

Current roulette winning number was #31
Roulette Fortune Bookie (Page 84): #33's signature group = 08, 11, 13, 16, 18, 21, 23, 24, 26, 29, 30, 31, 35, 36.
(Roulette Fortune Bookie Page 80): #31's signature group = 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35.
Ray's bank roll : 172 bet unit + 36 bet unit won - current betting 14 bet unit = 194 bet unit remained

Ray won. He won \$35 + \$1 original bet = won \$36. He now picked up the current winning number #31's signature group to begin a new betting cycle. **He bet \$1 each** on 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35. A total bet of \$14 for the next spin, \$194 remained.

Current roulette winning number was #1
Roulette Fortune Bookie (Page 80): #31's signature group = 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35.
Roulette Fortune Bookie (Page 20): #1's signature group = 02, 03, 04, 05, 12, 13, 14, 16, 17, 23, 27, 28, 36, 00
Ray's bank roll : 194 bet unit - current betting 28 bet unit = 166 bet unit remained

Ray lost. He did not pick up #1's signature group to begin a new betting cycle. Ray stayed with #31's signature group until won. **Ray now bet \$2 each** on 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35 until won. A total bet of \$28 for the next spin, \$166 remained.

Current roulette winning number was #31
Roulette Fortune Bookie (Page 80): #31's signature group = 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35.
Roulette Fortune Bookie (Page 20): #1's signature group = 02, 03, 04, 05, 12, 13, 14, 16, 17, 23, 27, 28, 36, 00
Ray's bank roll : 166 bet unit - current betting 42 bet unit = 124 bet unit remained

Ray lost. Ray did not begin a new betting cycle. **Ray now bet \$3 each** on 04, 06, 08, 11, 13, 18, 21, 26, 28, 29, 32, 33, 34, 35 until won. A total bet of \$42 for the next spin, \$124 remained.

Current roulette winning number was #13
Roulette Fortune Bookie (Page 20): #1's signature group = 02, 03, 04, 05, 12, 13, 14, 16, 17, 23, 27, 28, 36, 00
Roulette Fortune Bookie (Page 44): #13's signature group = 08, 09, 10, 11, 12, 14, 15, 16, 17, 23, 26, 31, 33, 36
Ray's bank roll : 124 bet unit + 108 bet unit won = 232 bet unit. If he quit now, he had gained \$132; less than one hour.
Ray's bank roll : 124 bet unit + 108 bet unit won - current betting 14 bet unit = 218 bet unit remained

Ray won. He won \$105 + \$3 original bet = won \$108. He now picked up the current winning number #13's signature group to begin a new betting cycle. **He bet \$1** each on 08, 09, 10, 11, 12, 14, 15, 16, 17, 23, 26, 31, 33, 36. A total bet of \$14 for the next spin, \$218 remained.

Current roulette winning number was #14
Roulette Fortune Bookie (Page 44): #13's signature group = 08, 09, 10, 11, 12, 14, 15, 16, 17, 23, 26, 31, 33, 36
Roulette Fortune Bookie (Page 46): #14's signature group = 01, 02, 11, 12, 13, 16, 17, 19, 23, 26, 27, 29, 34, 36.
Ray's bank roll : 218 bet unit + 36 bet unit won = 254 bet unit. If he quit now, he had gained \$154; less than one hour.
Ray's bank roll : 218 bet unit + 36 bet unit won - current betting 14 bet unit = 240 bet unit remained

Ray won. He won \$35 + \$1 original bet = won \$36. He now picked up the winning number #14's signature group to begin a new betting cycle. He bet \$1 each on 01, 02, 11, 12, 13, 16, 17, 19, 23, 26, 27, 29, 34, 36. A total bet of \$14 for the next spin, \$240 remained.

You can use the given signature group to win at casino.

You have to wait until one of these numbers appear as winning number

1, 2, 5, 13, 14 , 31, 33, 34,

Then Bet the same signature group until you win,. If you lose, increase your bet by \$1.

You can refer to this new book "[Roulette Fortune Bookie](#)" which is on sale in amazon.com.

91. American Roulette Tracker's Strategy

American Roulette Tracker's strategy is the only one and true roulette fun entertainment system. It is very easy to use, just follow Sereken's pre-picked 8 number group for easy betting and to enhance your leisure entertainment. However I do not recommend using this strategy for heavy betting or regular income resources.

I will show an example how it works.

If The last winning number was "28":

Our strategy is to bet *equal value on every one of the following numbers: **02, 04, 10, 22, 26, 29, 31 and 35** for a maximum of 5 spins. See following notes for details.

Notes:

1. *Equal value: Bet \$1 x above 8 numbers = \$8 per single spinning.
2. At all time; bet no more than 8 numbers per single spinning.

Bet on these same 8 numbers for 1 to 5 consecutive spins until scored, a maximum of 5 spins. We suggest, once the number hit, stop the current betting cycle (1 - 5 consecutive spins). And pick up a new number group to begin a new betting cycle.

- If scored at the 1st spin..... mission accomplished. End this 8 number group cycle. Pick another number (current last spin) to start a new group cycle.

<Bet 1st time x 8 numbers = total bet \$8, win \$35, net gain=\$27>

- If scored at the 2nd spin..... mission accomplished. End this 8 number group cycle. Pick another number (current last spin) to start a new group cycle.

<Bet 2nd time x 8 numbers = total bet \$16, win \$35, net gain=\$19>

- If scored at the 3rd spin mission accomplished. End this 8 number group cycle. Pick another number (current last spin) to start a new group cycle.

<Bet 3rd time x 8 numbers = total bet \$24, win \$35, net gain=\$11>

- If scored at the 4th spin mission accomplished. End this 8 number group cycle. Pick another number (current last spin) to start a new group cycle.

<Bet 4th time x 8 numbers = total bet \$32, win \$35, net gain=\$3>

- No matter wins or loses at the 5th spin, end this 8 number group cycle. Pick another number (current last spin) to start a new group cycle.

<Bet 5th time x 8 numbers = total bet \$40, win \$35, net loss=\$5>

<Bet 5th time x 8 numbers = total bet \$40, win \$0, net loss=\$40>

In order to increase your odds of winning: Look at the last 5 winning numbers on the scoreboard before going into the game. If most of our numbers scored at 1st, 2nd and 3rd spinning, these 8 numbers group should work well on this table. A short cut of how to apply our 1-2-3 winning rule is, usually the long red or long black works well with our numbers. Short black or short red usually does not work well with our numbers. 3 or more than 3 blacks in a row are considered as long black; 3 or less than 3 blacks in a row are considered as short black.

92. **Step by Step guide to pre qualify the dealer at roulette**

You walk up to a roulette table. Usually there are players there already, and a few or many spins have already been played. You should see a score board next to the roulette spinning wheel. There are some red/black/green numbers displayed on the score board. These numbers were the winning numbers that are in the order of the most current roulette winning results. Compared several most recent spins, see whether the numbers on the book would have won within 3 spinning. If you are not an experienced roulette player, you should use the 14-number group for Roulette Fortune Bookie instead of the 8-numbers group, because the 14 number group covers more numbers and has a bigger chance to win. The pre-qualify process for the 8-number or 14-number group are the same.

I will illustrate using an example. The roulette score board now displaying: 32, 0, 0, 36, 7, 24, 24, 2, 14, 30, 16.

The 16 was the most current roulette winning number. You back track about 8 numbers, which should be #36. If you looking at the book page 88-the last winning number was #36: The #24 had scored, #24 was hit within the 3 spinning. #24 was included in the 14-number signature group.

If you looking at the book page 64-the last winning number was #24: The #14 had scored, #14 was hit within the 3 spinning. #14 was included in the 14-number signature group.

If you looking at the book page 44-the last winning number was #14: The #16 had scored, #16 was hit within the 3 spinning. #16 was included in the 14-number signature group.

That's what pre-qualify the dealers means. This is a good roulette table to do the betting and you should win at this table, because this table/ dealer's signature matches with the book's pre-picked numbers.

Or, you double check every single number starting with #36, which should be the most proper way to do:

#36 scored #24 within 3 spinning.

#7 scored #30 within 5 spinning.

#24 scored #14 within 3 spinning.

#24 scored #14 within 3 spinning.

#2 scored #14 within 3 spinning.

#14 scored #16 within 3 spinning.

#30 scored unknown yet.

#16 scored unknown yet.

Since most of the above numbers scored within the 3 spinning. So this is a good roulette table to stay.

In any system that you uses, pre qualify your table first before playing..

91. **S99.9 Roulette System**

The gambling tips and roulette tricks you'll discover in a moment are so effective; that the gambling professional Steele, has been recognized by many casinos as the most dangerously knowledgeable gambler with the smarts to take down the house. He is a world class player and an acknowledged authority in the field of Gambling. I am thoroughly impressed with the strategy he uses and I modified to increase the probability to a higher level.

S99.9 Roulette strategy offers 99.9 % chance of returning a profit when a simple betting rule and progression are followed accurately and strictly.

Whether you're only familiar with blackjack, poker, baccarat, craps, or slot machines, it makes no difference at all... because you will learn the winning tips step-by-step through the entire winning process. What you're about to explore is the roulette techniques that will outperform and outwin any of the other casino games by over 200% and will put thousands of dollars into your pocket.

I and thousands of others have overcome the losing streak, and are now winning constantly...even though some have never gambled in a casino before. His breakthrough strategies and tips have catapulted my income an extra \$30,000 within 8 months. This is why I KNOW for a fact, that walking into a casino...it's suicide without the following information.

These secrets will not be revealed here forever so keep your eyes glued to this page! The casinos are getting very upset, and I can't guarantee you that you'll have this same opportunity again. You just cannot imagine what you are on your way to discover! It's shocking.

With this unique strategy you're about to learn, there will be no theories, no B.S., no outdated roulette techniques- nothing but down to earth, practical, and proven roulette strategy which will take your gambling experience to the next level at blinding speed. You're not going to be taught stuff that "sounds" good in theory but doesn't work in a live casino. You're not going to learn outdated ideas that just don't cut the mustard. You ARE going to discover a proven roulette strategy and system that you can use immediately to increase your income.

It's time for you to see for yourself, how to make thousands of dollars each and every week, discover new KILLER moneymaking secrets...learn about this breakthrough strategy which will skyrocket the amount of money you make doing what you love... playing ROULETTE.

Best of all, I have taught literally thousands of people like yourself and others from around the world, my system of making money. This formula can be applied by ANYONE who wants to win money playing roulette.

Approximately 84% of the players lose their money at the casino because they walk in unprepared. This is why I guarantee, you will increase your winnings by at least 100% on your next visit to the casino if you use this step by step strategy.

This strategy uses the concept of probability theory, the law of ecart and the law of balance.

Law of ecart is an unequal frequency between two opposite chances.

Law of balance is the equilibrium of the two opposite chances.

Without the law of ecart, law of balance and the law of probability, the game of roulette cannot be predicted. The balance must appear sooner or later but will definitely happen.

This strategy is both valid for **American and European wheel** at online or offline casino.

This strategy is valid for **either dozen or column bets** by pre qualifying your table and casino.

- Step by step of putting S99.9 Roulette System into reality.

Step 1: Spend some time at the roulette table prior to commencing play and write down the previous winning numbers of each spin.

Pre qualify the table first based on the last 10 winning numbers.

To qualify, at least 80% of the sectors hit within 4 spins. Use the last 4-5 winning numbers to determine.

Example: 13, 23, 33, 36

Number 36 is the most recent winning number. Assume I want to bet on dozen sector. 1st dozen(1-12),
2nd dozen(13-24), 3rd dozen(25-36).

Step 2: Identify the least recent dozen sector.

13-2nd dozen

23-2nd dozen

33-3rd dozen

36-3rd dozen.

Therefore the least recent dozen sector is 1st dozen. According to the law of ecart, law of balance, and law of probability, the balance will happen sooner or later but will definitely happen.

BET on 1st dozen.

To clarify again. If previously winning numbers were 21, 34, 36, 1(most recent),.....next spin.

Bet on 2nd dozen.

Step 3: Use the betting progression system below.

NO	Bet Unit	Total Winnings
1	1	2
2	1	1
3	2	2
4	3	2
5	4	1
6	6	1
7	9	1
8	14	2
9	21	2
10	31	1
11	47	2
12	70	1
13	105	1
14	158	2
15	238	4
16	356	2
17	534	2

“No” column indicates the number of times you bet on same dozen.

“Bet Unit” column indicates the amount of unit you should bet.

“Total Winnings” column indicates the amount of units you win for this series.

Using the first example, the first bet is on 1st dozen sector. **Bet one unit on 1st dozen.**

If the table minimum is \$5, then 1 unit = \$5.

If the table minimum is \$25, then 1 unit is \$25.

If the first bet loses, you bet 1 unit on the same 1st dozen (refer table to NO=2, Bet unit=1).

If the second bet loses, you bet 2 units on the same 1st dozen (refer table to NO=3, Bet unit=2).

If the third bet loses, you bet 3 unit on the same 1st dozen again(refer table to NO=4, Bet unit=3).

If you win on 3rd betting, you win 2 units.

Please stick to this mechanical strategy until you win. I want to emphasize this again. **STICK to this strategy with confidence and winning attitude.** This is a **Sure winner roulette system.**

Once you win, restart at step 2 again to find new recent least dozen sector. Restart with one unit again.

Many bets win on first bet. On the average, you will win within 1 to 4 spins. The chance of winning within 7 spins is 99.9%. Very rarely, the losing streak will be over 9-16 spins. It does not mean that it will not happen.

The size of the bankroll determines your bet unit. This is very important!!!

The value of 1 unit depends on the size of bankroll, normally 1 % of bankroll. For \$5 bet, you need a bankroll of \$500.

Stick to the 1% rule if you want to survive long term. Most gambler fails because of not meeting this 1% rule. For sure winner, 0.1% of bankroll is the optimum rule.

Please check on one of the 101 roulette winning tips. You will guaranteed to win using this method, but to win consistently, you must follow all 101 roulette winning tips diligently.

If you lose, it does not mean that the strategy does not work. But you are the one to blame for not following the roulette winning tips. Choosing the right roulette strategy is as important as choosing the right dealer, right table and follow the 101roulettewinningtips, especially do's and don't.

TRUST ME, you will surely lose if you do not follow this advice and my roulette winning tips.

92. Play Roulette as an Investment Strategy

This strategy is one of the alternative and innovative ways for making money with virtually almost no work by investing in Roulette.

Some professionals also use this information source for professional winners in investing and Roulette gaming.

It doesn't matter if you are rich or poor, invested or gambled before, play and invest online, or offline; it's easy to make enormous profits playing Roulette as an investment if you know how to do it.

One thing I should mention right off the bat is that you must reject old ways of thinking. The real key to significant wealth is your thinking process. You must be able to follow innovative and alternative ways of investing and playing Roulette. But foremost, you must think BIG.

I found out that there was no single magic solution to make me a fortune playing Roulette or investing in the stock market. But trying and researching new concepts became a process for me...I combined lot of ideas to generate a large, proven cash flow system. To do this, I had to learn to maximize the best from all techniques in investing and gambling.

There are literally hundreds of ways to invest in the market and/ or gamble in a casino. Combined, my team and I have tried them all; the conventional, the unconventional - the ethical, the risqué - the complicated, the simple - the common and the crazy. Let's see how it all played out...

You see, gambling, and especially Roulette, is probably one of the least studied and least written about money making and investment strategy of our times.

You and I know that there have been numerous books written on different casino games and systems. But if we think about it, we find that with the exception of Blackjack, most of these authors have applied little, if at all any real scientific approach to the games. Have you ever wondered if you could play Roulette as an investment?

While researching what approaches to beating Roulette different authors are taking, my team and I really only identified two approaches:

1. An author will discuss the rules of how to play Roulette and then dismiss the possibility of consistently winning the game because of the casino edge over the player.
2. An author will present a "system" how to beat Roulette, without any evidence whatsoever that it works.

Most respectable books on Roulette, such as those you can find at a bookstore, will use the first approach. That way, the author handles the subject of playing Roulette in a risk-free manner, since all those "experts" agree that Roulette cannot be beaten, and thus they flat-out reject the possibility of making a living from "investing" in Roulette.

The second approach is often used by the fly-by-night outfits, where some smart guy will sell you his "winning" system which he claims to use constantly to beat the casino. Unfortunately, these people will never present you with any evidence that their claims will really work. In fact, they do not even give any scientific reasoning, why their system should

beat the game of Roulette. This approach is so worthless, yet so common, that I even found "winning systems" based on Astrology and "Positive Thinking". Why serious players/investors would spend their money on such non-scientific, unproven methods to winning Roulette is beyond me.

I have personally played the game of Roulette for many many years. I played mostly in casinos in Europe, and in the United States. My uncle has been a professional gambler all his life and I guess it came naturally to me to educate myself on beating Roulette over the years. I devoted considerable time and resources to learning statistics, computer software applications, and actual playing time in the casino to develop a consistent approach to winning at Roulette. It was not until I combined stock market analysis, mathematics, testing and revised playing before I was able to overcome the house edge. But the real breakthrough came last year, when I partnered up with other professional gamblers from around the world who shared their knowledge and we founded this site. This team of professionals approached the game of Roulette for the first time as a legitimate investment opportunity.

When we first began studying and analyzing Roulette, we shared our research findings from around the globe. As we went through manual testing of different approaches, we realized that the use of computers would help us in saving time and energy while devising a winning [investment strategy](#) for Roulette. Each new twist in our approach was then tested in a casino to see if it would work.

By using advanced computer software, we were able to identify the best betting patterns and money management methods. You see, we use proven and sound mathematical principals that occur in Roulette on

which we base our investment strategy. Then, just like "entry" and "exit" points in the stock market, we know exactly when and how to bet.

Let me explain this approach to you. In many ways, investing in the stock market, the commodities markets, or buying and selling options is very similar to playing the game of Roulette. Both have certain probabilities to winning and losing.

In statistics, we consider the commodities market, as well as the game of Roulette to be zero-sum games. That means the amount of money you win is equal to the amount I lose. That way, the sum of all wins and losses is zero. If you bet red and you win, the house loses the exact amount equal to your wager. If you bet black and the Roulette decision is red, you lose your wager. In the end, it is a zero-sum.

The field of statistics grew tremendously during and after World War II. The United States and the United Kingdom were the dominant force in advancing this field. After the war, most of the newfound principles were applied to the business world. We find statistics in management, stock market forecasting, economic planning, and even sociology.

Zero-sum means that whenever you win, the house loses -- there cannot be two winners. Now you may asked, "But what about the house edge? Doesn't the house always win in the long-run? How can you beat Roulette consistently?"

Well, all good questions. In fact, these are the same questions my team and I asked ourselves as well. Whenever we compare playing Roulette to investing in the stock market, we find that your brokerage fees are like the house advantage. Without paying your broker a commission, you are not allowed to play the stock market game. On that same token

you are not allowed to play the Roulette game, if you are unwilling to pay the house its commission, i.e. the house edge.

You can win a zero-sum game, yet still miss coming out ahead because of these transaction costs. Let me give you an example:

A great way to scientifically beat the option market with contained risk and 87.5% winning trades guaranteed is by following a credit spread strategy.

It is a well-known fact that stock prices tend to trade in ranges about 80% of the time. The other 20% of the time the prices will move in powerful trends. That means that it is very common for markets to move sideways - like treading water. Overall the, prices spend little time in pronounced uptrends or downtrends. Check any annual stock chart, and you will see what I mean.

If you want to make money during this time, all you need to do is to choose a market (e.g. the S&P 100 with its symbol OEX), and then put on a credit spread. This will make you good money and contain any eventual losses to a predetermined level, because the market tends to trade between +5% and -5% of its current price in 87.5% of the times. That means, this technique will make you money 87.5% of your trades! Now you ask, "What is a credit spread, ?" Well, that's easier than your broker wants you to know. Let's say the OEX is at 646.16. We will go ahead and sell a call that is 5% above the current market price and a sell put that is 5% below the current market price. So we are looking to sell a call around 678.47 and sell a put around 613.85. Now, go ahead and check the closest strike prices around these numbers that are four weeks out. If it was end of June, look for options expiring end of July. OK, so for the July 680 call we collect 7/8. Each point is worth \$100, so

that translated to \$87.50. For the July 615 put we collect $2\frac{7}{8}$, which is \$287.50. You just made \$375 minus commission, if the OEX stays in this range until expiration. Warning! If it doesn't, your potential loss is unlimited! That's why we reinvest part of our \$375. What we'll do is buy a call that is one strike price further out than the 680 call we sold. That would be the July 685 call, which let's say was priced at $\frac{3}{8}$, or \$37.50. The put we want to buy is the July 610, which is one strike price further out than the 615 we sold. That will cost us $2\frac{1}{8}$, or \$212.50. Together, we made \$375, but spent \$250. That nets us \$125 in profits. Our risk is restricted to our invested \$375 and our expected winning odds are 87.5%.

Now, that's a conservative way of making good money. You're only problem is your broker's commission. A discount brokerage will charge you about \$40 for this strategy. Here it is again, the house edge. You risk your money, they risk no money. They always come out ahead...

That's why we looked at Roulette as an investment vehicle. Here, the house is risking its own money playing against you -- unlike your broker who is risking nothing.

In fact, [we found a way to play Roulette as an investment](#) that is even better than the option strategy I just showed you. Think about that for a minute. That means that nowadays, you could even be making money right out of the comfort of your own home by playing online, instead of going to a casino. In fact, I play every night when I come home from work for about 30-45 minutes. I found an online casino that I can trust.

So now, you can learn:

- Learn **how** to keep from losing your shirt and start making money playing Roulette
- **Under \$300** needed in bankroll to master the strategy.
- **NOT** a double up system - also called Martingale Progression.
- The system is **NOT** complicated and YES *I will be here to guide you* on how to play and beat the Casinos.
- A method that has been **tried** and **tested** in Casinos around the world.
- **No detailed** planning or **clocking** needed.
- A proven and tested system for beating the Casinos.

This strategy uses “ **TREND is MY FRIEND, DO NOT GO AGAINST IT**”

This system is based on betting on repeat numbers. It works like this, if the number 36 shows you start by placing one unit on 36. If the next number to show is 33, you place one unit on both numbers 36 and 33. If 12 now appears, you place one unit on each of 36, 33 and 12 and so on. After the 7th bet you put two units on each number and this goes on for up to 12 spins. The progression is 1 to 6 units for up to 12 spins. If one of your numbers hit you make a small profit and start over from the beginning. They also mention that you should wait until you have three repeats within 14 spins to start betting.

93. Paroli System

This is a Positive progression system, the opposite of the Martingale System.

This system is in a way the opposite of the Martingale system. You start with one bet and you increase your bet when you win rather than when you lose.

However, you will need to plan a betting procedure whereby you know how far you will let the bet build before you take it down to the initial starting bet and how much to raise after each win. This obviously depends on the type of game played and the odds of the bet.

The advantage of this system is that you do not require a large bankroll. It lets the profit run and cuts short the losses.

* **Positive progression betting systems:** You increase the bet when you win. Kind of 'let-it-ride'. Require less capital and usually employed to take advantage of winning streaks.

94. **1-3-2-6 system**

This is money management betting system.

The name of this system says it all. It is similar to the Paroli system. It is based on the premise that you can win four times in a row.

Your initial bet is **1** unit, the second **3** units, the third **2** units and the fourth **6** units. Let's assume that each unit is \$10 and the odds are 1:1 - even money.

The first bet is **\$10**. When winning, \$10 is added to the \$20 on the table making the second bet **\$30**. When winning again on the second bet, there would be \$60 on the table. Of this you take down \$40 and the third bet is now **\$20**. If the third bet wins, you will have \$40 on the table to which you add \$20 making a total of **\$60** for the fourth bet.

If the fourth bet wins, there would be a total of \$120, of which \$100 is net profit. Now all the bet with the profit is taken down and you start the system all over again at \$10.

If you lose the first bet, your loss is \$10. The second level loss is \$20. At the third level, a loss will give you a net profit of \$20. At the fourth level, a loss leaves you breaking even. Each time you lose, you start all over again at \$10.

The attraction of this system is that you risk \$20 at a chance of making \$100 net profit. This means you can lose five times, and with one win get your money back.

94. **The D'Alenbert system:**

This is a Money management betting systems cum gambling systems.

It uses a Negative progression.

This is a mixture of Martingale and Insurance systems. Bets are raised one unit after each losing bet and lowered one unit after each winning bet. The sequence and amount raised or lowered can be varied to suit particular games and odds.

- **Negative progression betting systems:**

You increase the bet when you lose. Require more capital and usually employed to force a winning outcome following a losing streak. (Nerve-wracking, very painful when you lose. Avoid these systems if you can.)

- **Insurance betting systems:**

You decrease the amount of your bet when you win, usually following a high initial bet or following short 'let-it-ride' progressive wins. (Play it safe. A good compromise.)

96. **The Labouchere system:**

This is a Money management betting systems cum gambling systems.

This Negative progression system, also called the 'Cancellation System'.

This system is also called the 'Cancellation' system. There are many variations. In its simplest form, you write down a series or a set of numbers; say, 1 2 3 4 5 6. The series can be short or long and not necessarily sequential such as 1 1 1 3 3 5 7. The choice of a particular series depends on the type of game you want to apply it to and the odds of the bet.

Each number represents the amount in units or bet unit to bet. You bet the first and last of these numbers. In this example 1 and 6, which totals 7 units.

If you win, you cross out the two numbers and bet the next two 'ends' (the outside numbers). In this instance 2 and 5. If you win again you bet on the next two remaining numbers 3 and 4, and if you win that too, you would have made a 'coup' or completed one game. Then you start all over again.

If you lose, then you add that one number to the end of the series. Say you lost your first bet of 7 units (1+ 6). Then you add number 7 to the end of the series to look like this: 1 2 3 4 5 6 7 and your next bet would be 8 units (1+ 7). If you won the first bet but lost the second 2 and 5, then the series of numbers would look like this: 2 3 4 5 7.

If you work it out, you will see that when the series is completed or when you make a 'coup', there is always a profit. The negative side of this system is that you could end up betting large sums of money even if your initial bet is small.

- **Negative progression betting systems:**

You increase the bet when you lose. Require more capital and usually employed to force a winning outcome following a losing streak. (Nerve-wracking, very painful when you lose. Avoid these systems if you can.)

97. **The Parlay system**

This system is similar to the Paroli system and has the effect of 'pyramiding' your profit. **Pyramiding is a parlay wager whereby the original wager plus its winnings are played on successive wagers.**

It is commonly used in horse racing betting. Basically you make a bet and if you win you re-invest the winnings on the next bet. You 'let it ride'.

This method of play is by no means risk free, but it offers the least amount of risk of all wagers since the player is only concerned with either a win, place or show selection or a combination of the three.

It is one of the oldest methods of wagering and was originally derived from the same premise that banking systems use to compound interest.

- **Positive progression betting systems:**

You increase the bet when you win. Kind of '**let-it-ride**'. Require less capital and usually employed to take advantage of winning streaks.

98. Spin Doctor Strategy

In roulette there are only 2 types of results, WIN results and LOSS results. These can come in runs of 1 or 2 in a row, 4 or 5 in a row, or less often 9 or 10 in a row or even greater. If you look at the results from any roulette wheel you will see these runs. **Runs of 3 or 4 or more frequently occur for even money chances.** What is needed is a roulette system that can capitalize on these winning runs to maximize profit, but allows you to quickly get in control when losses occur, keeping them to a minimum.

Most people play roulette without following any rules or guidelines and they wonder why they lose. To improve the odds of winning at roulette what is needed is a good money management system and betting strategy.

Spin Doctor uses even money chances as these offer the best odds of winning in roulette. The system is proven to make the most of winning runs and lose as little as possible on losing runs.

Spin Doctor is clearly for real even money players. You bet the same outcome (red/black , odd/even, high/low) as previous outcome until at least 4 runs.

99. System 99 Strategy

System 99 is the first roulette system offered by MRT-Research. **SYSTEM 99** offers a greater than 99% chance of returning a profit when a series is played to completion. A series can last between 1 and 5 spins. Each spin itself has a 63% chance of winning (65% on single zero wheel). Most bets win on the first spin. Can you lose? Yes you can, however it is very unlikely. You have a less than 1% chance of losing.

The only system in the world that guarantees a winning profit on average 99 times out of 100 in only 1 to 5 spins!

This exceptional strategy is based on a simple betting rule and a progression system. **Stakes are placed on 12 number bets - dozens or columns. Dozens pay out 2:1. You choose any 2 dozens or 2 columns to play at random.** The system is valid for both American and European roulette wheels.

System 99 will provide the player with a fast, efficient and reliable way to profit quickly and consistently.

The simple logic behind **System 99** is that the first spin has a 63% chance of winning (65% on a single zero wheel). Most bets win on the first spin. However, if the first bet fails, the second bet also has a 63% (65% single zero) of returning an overall profit. If the second bet still fails, the third has a 63% chance of returning an overall profit and so on until the fifth and final spin of the series. You only have to win 1 in 5 spins to return a profit and each spin has a 63% chance of winning. The probability of winning within the 5 spins series is greater than 99%.

System 99 was tested at Starluck Casino.

The results are outstanding!

The results show clearly that the progression is steady and consistent.

- **63% of all bets won on the first spin!**
- **23% won after the second spin!**
- **Only 13% took 3 spins or longer to achieve a gain!**

For details, please refer to

<http://www.101roulettewinningtips.com/roulettetips/freeroulettesystem.html>

100. **Win Street Strategy:**

Win Street is based on the appearance of six lines or double streets in combination with a strong progression and differential betting. The betting selection is both valid for the American and European wheel. The layout of the wheel has absolutely no effect on the appearance of the streets or any other chance, with the exception that there is one more 0 in the American wheel, the Double zero.

Win Street is based on the mathematically sound Law of the Third which states that in 6 spins on average only 4 lines will appear. To win with **Win Street** it is sufficient to reduce losses and observe the roulette wheel's decisions.

The roulette wheel's decisions are governed by two undisputed laws:

The law of Ecart:

An Ecart is an unequal frequency between two opposite chances. For example, if in the last 10 spins red came out 3 times and black came out 7 times, we have an Ecart on black.

The law of Balance:

The equilibrium of two opposite chances. For example, in the last 10 spins we have 5 reds and 5 blacks.

Without the law of balance the game of roulette can not be calculated.

The balance must appear sooner or later but will definitely happen.

Win Street makes use of the law of balance by observing spins and making a betting selection based on what has gone before adding to the players advantage.

Win Street must surely be the choice of the intelligent roulette player.

The actual results of **Win Street** tested at Starluck Casino was Outstanding.

101. **PIVOT Roulette System**

Spend some time at a roulette table prior to commencing play and write down the winning number of each spin until one number repeats. The repeat number is your "pivot number" and therefore the number on which you place your first bet.

Example: 12 23 33 36 29 7 8 12 4

Number 12 is the first repeat number and therefore the "**pivot number**". Number 12 will remain the "pivot number" for the next 36 spins in a row unless it wins.

Bet the same amount on your pivot number for each spin until you either win or lose at the end of the thirty-sixth spin. A win on a single number in roulette will pay 35/1, so if your "pivot number" spins up anytime throughout the 36 spins you will be a winner. (Or break even if it comes up on the last spin.) Naturally, the earlier your "pivot number" spins up the better the profits because your profits will decrease with every spin of the wheel.

When you have a win, stop betting on that "pivot number" and select another one to start the process over again.

Why Does It Work?

It is a fact that numbers on a roulette wheel tend to repeat often. On average, the same 24 numbers will appear in 36 spins of the wheel. Rarely, if ever, will all 36 numbers appear in 36 spins.

What does this mean? It means that on average, in 36 spins, you must have 12 repeat numbers. This could be just one repeat of each of the 12 numbers but it will more than likely be a repeat of few numbers coming up three or even four times each. This is not theory. It is proven fact derived from thousands of spins of a roulette wheel. What we have just described simply keeps on happening over and over again!

It's what's called the theory of uneven distribution. During a short trial of 36 spins, not all numbers will appear, but certainly over trials of millions of spins all roulette numbers will even out.

102. Shower roulette system

RULES OF SHOWER ROULETTE

1. Record the results of 60 spins off 4 different tables, this is so that you can be certain that one wheel will qualify.
2. As the numbers come out place a mark next to each number on your scorecard wheel diagram.
3. Do your final update after 60 spins, then quickly select the wheel which you will be playing.
4. Select one of the wheels where at least 4 numbers, together on the wheel, have come out at least twice.

This group must be bordered, immediately on both sides by a number that has only been out a maximum of once.

5. You may have only 4 numbers in a group like this or even 5, 6, 7, 8 or 9 numbers together.

You may also have 2 groups like this, on the same wheel.

What you do is bet on all the numbers in the group, or groups, immediately, straight up for the next 30 spins.

6. Do not select a table where there are more than 2 groups.
7. Each group must include at least 1 number that has been out at least 3 times.

If you have a group of 4 or 5 numbers and they have all been out just twice, avoid this one.

8. A group that has 6 or 7 numbers must have at least 3 numbers that have been out at least 3 times.

A group with 8 or 9 numbers must have at least 4 numbers that have been out at least 3 times.

9. Do not go past 30 spins, because this has been calculated so that if you are playing 4 numbers, as an example, and they each come out just once, you will still be up in profit.

Should there be a possibility of a bad run developing then this will prevent too much damage to your bank.

10. Put all your winnings back into your bank.
11. Start with a \$500 bank, with a backup of \$500 if you are starting off playing with \$5 bet unit.

If you are starting off playing with \$2 bet unit then you would need a bank of \$200, with backup of \$200.

This backup is just incase you hit a poor run during your initial start up. Later on, your ever increasing bank, should cover any slip ups.

12. Every time you double your bank double your bet. When your bank has reached \$3,000, play every game there after with \$25 bet unit, unless the bank drops below \$2,500 after the 30 spins have been played, in which case go back to \$20 bet unit.

103. Dr Neubauer's Casino Buster

His Casino Buster system is the first and only roulette system in the world that claim to guarantee 100% to win. For more detail, you can visit the following website :

[Dr Neubauer's Casino Buster Roulette System](#)

From my [review](#) and testing, this is a difficult system and you can lose a lot if your guess is wrong.

Casino Buster is basically a guessing game. What you're told to do is divide the table into the six lines, 1-6, 7-12, 13-18, etc. You then look at the last 8-10 numbers that showed and see what section they hit in and try to guess the next section to hit based on the pattern of the previous numbers. Too much guessing and most often times you guess WRONG.

104. Ray's Tactical Delayed Sure Win System

Rules to follow

1. Wait until the winning numbers land **four** times in a row on one of the "dozens" and/or if the numbers land **four** times in a row on one of the "columns".
2. Bet 5 units on each of the other two dozens and/or bet 5 units on each of the other two columns. Most of the time you will win.
3. If you lose, triple your first bet.
4. If you lose again, count your losses and start back at step 1. Avoid betting large sums on the long runs and you will keep ahead. There will be countless small runs to make up for a possible 40 unit loss but probably not enough to make up for a 270 unit loss very quickly. So, be wise.

I encourage you to make modifications to my system, since it is not for everybody. Here are a few modifications:

1. Wait until the winning numbers land six times in a row or seven times in a row (depends on how patient you want to be; seven times in a row is a rare occurrence so be prepared to wait)
2. Then, bet 25 units on the opposite dozens/columns to make a decent profit or just keep your money close and only bet 5 units per dozen/column.
3. If you lose, triple your bet
99% of the time , you will guaranteed to win using this system.

105. The Law of the Third

As most of the professional gamblers know, the probability that one of the 37 will be drawn in a single spin is 2.7% or, to be more precise $1/37$. The statistics teach us that in a complete cycle of 37 spins, on average there will only be 24 numbers drawn one or more times, while the others 13 will not be drawn

Negative probability is $(36/37)^{37} = 0.3628 = 36.28\%$ $37 \times 0.3628 = 13.42$ which, as you can see is more likely to be 14 than 13 numbers.

The "Cycle 39":

To obtain more precision its better to apply a cycle of 39 spins instead than a cycle of 37. Negative probability in this case is $(36/37)^{39} = 0.3435 = 34.35\%$ $37 \times 0.3435 = 12.7$. As you can see this "long cycle" give us 13 numbers that will not come out.

The following systems are based on the "Cycle 39".

All these systems use only numbers in frequency (normal or super), and exclude the absent ones (Joint probability distribution).

106. There is another approach, called **My 6 Roulette Systems**:

This report tells you a lot of good facts that will enable you to start playing intelligently with systems and making money immediately! The report explains betting and odds clearly. Plus, most of my systems offer you a 63+ % chance of winning! Whether you are a roulette pro or a beginner you will find unique strategies to guarantee a win at the roulette tables. Follow these systems & start winning at the casinos and take THEIR money!

107: Game in Team is another method that avoids the mistakes made by other system. The basic principal or characteristic is moderate capital and less risk in critical situation such as long runs. These strategies can allow you to win consistently and minimize your risk.

108: **The Ultimate Expectancy Theory** states that within the acceptable casino environment(casino, table, dealer), the spin will expect to keep the ball and the range of the ball close to where it landed last or the range of the numbers located directly across the wheel from the last hit. Based on this expectancy theory, I have analysed and come out with a special formula for betting basing on the last winning HIT. The last winning number (HIT) is the **KEY**. Once you know the last winning number, key, take the appropriate action as stated below.

KEY	American Roulette(Action) Bet	European Roulette(Action) Bet
0/00	1 st dozen, 3 rd dozen (notation: 1/3)	Do Not Bet
1	2/3	1/2
2	2/3	2/3
3	1/2	1/3
4	1/2	2/3
5	1/2	1/2
6	1/2	1/3
7	1/3	1/3
8	1/3	2/3
9	1/3	Do Not Bet
10	1/3	1/3
11	1/3	1/3
12	1/3	1/3
13	2/3	1/3
14	2/3	2/3
15	2/3	Do Not Bet
16	2/3	1/2
17	1/2	2/3

18	1/2	Do Not Bet
19	1/3	1/2
20	1/3	2/3
21	2/3	1/2
22	2/3	Do Not Bet
23	Do Not bet	1/3
24	Do Not bet	1/2
25	1/3	2/3
26	1/3	1/3
27	1/3	1/3
28	1/3	1/3
29	1/3	1/3
30	1/3	Do Not Bet
31	2/3	2/3
32	2/3	1/2
33	2/3	Do Not Bet
34	2/3	Do Not Bet
35	Do Not Bet	Do Not Bet
36	Do Not Bet	1/3

This formula will give you about 85-90% balance of probability winning the roulette. With the understanding of the 101roulettewinningtips, I find this system reliable and have been using this fantastic winning roulette formula.

Example on how to use ultimate expectancy theory:

If the last winning number is 30 for American roulette, bet \$5 on 1st dozen and \$5 on 3rd dozen.

If you are playing the European roulette, then **DO NOT BET** for last winning number of 30

Advanced Betting strategy on Ultimate Expectancy Theory

This strategy is for advanced players, I do not recommend that you use this strategy until you master the basic ultimate expectancy theory method. This strategy is not for everyone but it will dramatically increase your winnings.

NO	Bet Unit per each dozen
1	1
2	3
3	9
4	28

Assume 1 bet unit is \$5.

If you lose the first spin on \$5, \$5 bet then the next bet amount will be \$15, \$15 with the new key number.

If you lose the next spin , the next bet amount is \$45, \$45.

99% of the time , you will win within 2 spins.

Here is an example if you are playing in a minimum table of \$5:

If the last winning number is 30 for American roulette, bet \$5 on 1st dozen and \$5 on 3rd dozen. If the subsequent winning number is 21(you miss the last spin), then bet \$15 each on 2nd dozen and 3rd dozen respectively.

If you hit the dozen, now you go back to the regular betting strategy starting with \$5 bet.

Assume if you miss the 2nd spin (winning number is 7), then bet \$45 each on 1st and 3rd dozens.

Bear in mind, there are risks involved in this method. If the luck is not on your side, you may lose. One of the biggest mistakes that people make when using this strategy is that **they don't have sufficient bankroll**. Make sure you have 30% more on your bankroll.

**And Now, The FINAL Roulette Strategy
that Guaranteed You almost 100 % Win.**

Revealing the Ultimate Roulette System!!!

**A dynamic approach of switching
between Ultimate Expectancy and S99.9
Roulette System. Most play based on a
single system will fail over a long term.**

**This roulette strategy is unbeatable and
has not failed so far. This is applicable for
most online and offline casino**

**Before you use this method, you must
play and master Ultimate Expectancy
method and S99.9 Roulette system with
great confidence. You can interchange**

between these 2 methods after every 5 wins and re-analyse the outcome of the LeaderBoard, Dealer and Ball.

Step 1: Initially you can use either the ultimate expectancy theory (UET) method to bet or interchange with S99.9 roulette system depending on your table pre-qualification.

Pre qualify your table first by analysing the past 10 spins to find out whether UET or S99.9 system is favourable.

To qualify , at least 80% of the bets must hit within 4 spins.

Start playing and Recording both the number and dozen. Eg. 23-2nd dozen, 35-3rd dozen etc

Re-Qualify the game after every 4-5 wins to ensure the dynamics of randomness. Based on our testing, the system may fail if you stick to the same system too long especially when playing on online casino.

Step 2: While playing, **Monitor the recent CONSECUTIVE 9 winning spin results to find out the scenarios where the winning spins that fall on**

**ONLY TWO DOZENS. When this scenario happens,
go to next step 3.**

Step 3: Change your strategy from ultimate expectancy theory method to S99.9 roulette system with the following betting adjustments.

- **Bet on the same dozen that does not appear at all in the last 9 spins until you win.**
- **Use this betting system/progression as follows:**

1 unit, 2, 4, 7, 11, 17, 26, 40, 61, 92 units.

If you miss the first spin, bet 2 units on the same dozen on your next bet.

If you miss the second spin, bet 4 units on the same dozen, etc. Continue until you win.

When you win , restart at Step 1. Reanalyse and prequalify the table.

This is a real life example to illustrate my Ultimate Roulette strategy.

PreQualification Stage:

Past numbers: 26, 13, 8, 2, 36, 10, 0, 20, 32, 17.....

Testing for S99.9%

Use last 3 numbers to test.

26 – 3rd dozen (D3)

13 – D2

8 – D1

Bet D3, hit at 2 spins(36)

2-D1

36-D3

Bet D2, hit at 3 spins(20)

0 neutral

20-D2

Bet D1, hit at 2 spins(17)

3/3 = 100% success. Can use S99.9%

Testing for UET for Advance Betting strategy

Key 26, Bet 1 unit on D13 (Dozen 1, 3) Lose

Key 13, Bet 3 unit each on D13 , Win

You win at 2 spins

Key 8, Bet 1 unit on D23, Lose

Key 2, Bet 3 unit on D23, Win

You win at 2 spins

Key 36, Bet 1 unit on D13 Win

You win at 1 spin

Key 10, Bet 1 unit at D13 Lose

Key 0, No Bet

Key 20, Bet 3 unit at D23 Win

You win at 3 spin

Key 32, Bet D12 Win (17)

You win at 1 spin

6/9=67% success for basic method-Not suitable

If advanced method is used, 100% success.

Either use S99.9% or Advanced UET

Assume European Roulette for better winning odds.

No	Previous spin	Action required	Current spin	Winnings
1	17	UET, Bet 1 unit on 2 nd /3 rd dozen	32	Win 1 unit
2	32	UET, Bet 1 unit on 1 st /2 nd dozen	19	Win 1 unit
3	19	UET, Bet 1 unit on 1 st /2 nd dozen	15	Win 1 unit
4	15	Do Not Bet	23	Zero win
5	23	UET, Bet 1 unit on 1 st /3 rd dozen	31	Win 1 unit
6	31	UET, Bet 1	35	Win 1 unit

		unit	on		
		2nd/3rd			
		dozen			
7	35	Do Not Bet	20	Zero Win	
8	20	UET, Bet 1	17	Win1 Unit	
		unit	on		
		2 nd /3rd			
		dozen			
9	17	Change	36	Lose	1
		strategy to		unit	
		S99.9 since			
		only 2 nd			
		and 3rd			
		dozen			
		appear. Bet			
		1 unit on 1 st			
		dozen			
10	36	S99.9, Bet	34	Lose	2
		2 units on		units	
		1 st dozen			
11	34	S99.9, Bet	23	Lose	4

		4 units on		units
		1 st dozen		
12	23	S99.9, Bet	2	Win 14
		7 units on		units
		1 st dozen		

Total Wins =20 units

Total Loses = 7 units

Net wins = 13 units.

After the wins, Restart with UET or S99.9%.

Use this method well as they are very powerful.

I would say it is almost 100 % sure to win.

One final advice, make sure you have sufficient bankroll to invest in this game.

I suggest using Minimum Bankroll= \$1000 for \$1 bet game. This is an investment not gambling. However, you may use less than \$200.

Anything less than the minimum bankroll, I will not guarantee that you will win 100% of the time. Try the Ultimate Roulette System using free casino money first before using real money.
